**DETAILED ACTION**

***Allowable Subject Matter***

1. Claims 62-74, and 91-102 are allowed.
2. The following is an examiner's statement of reasons for allowance:

Claims 62 and their dependents thereof, are allowed because the closes prior art, Campana (US Patent No. 5,710,798) and Umeda (US Patent No. 5,920,817), either alone or in combination, fails to anticipate or render obvious an image data communication system, comprising:

an image data distribution device for sequentially distributing, over a transmission resource, a plurality of sets of identical moving picture image data with prescribed time differences; and

an image data reception device for receiving, from the transmission resource, moving picture image data that are distributed from said image data distribution device while moving among a plurality of radio areas,

wherein when the transmission resource is sufficient to distribute the moving picture image data,

said image data reception device, at a time of handover that occurs when moving from a current radio area to another neighboring radio area, receives over a prescribed interval said plurality of sets of identical moving picture image data having prescribed time differences that are distributed from said image data distribution device and selects necessary data from the received moving picture image data to reconstruct one set of moving picture image data, and

said image data distribution device, during only said prescribed interval, performs priority control such that said plurality of sets of identical moving picture image data having prescribed time differences are received together in said image data reception device, and

wherein when the transmission resource is not sufficient to distribute the moving picture image data,

said image data reception device, at the time of handover, receives only one of said plurality of sets of identical moving picture image data, and

said image data distribution device performs priority control by discarding ones of said plurality of sets of identical moving picture image data other than said only one.

Specifically, Campana and Umeda, either alone or in combination, fails to teach “when the transmission resource is not sufficient to distribute the moving picture image data, the image data reception device receives only one of the plurality of sets of identical moving picture image data, and the image data distribution device performs priority control by discarding the other sets of identical moving picture image data”.

Claims 91 and their dependents thereof, are allowed because the closes prior art, Campana (US Patent No. 5,710,798) and Umeda (US Patent No. 5,920,817), either alone or in combination, fails to anticipate or render obvious An image data communication method carried out in a communication system in which an image data distribution device and an image data reception device are connected so as to allow distribution of moving picture image data by way of a transmission resource, said image data communication method comprising:

when the transmission resource is sufficient to distribute the moving picture image data,

a first step in which said image data distribution device sequentially distributes a plurality of sets of identical moving picture image data with prescribed time differences to said image data reception device;

a second step in which said image data reception device, at a time of handover that occurs when moving from a current radio area to another neighboring radio area, receives over a prescribed interval said plurality of sets of identical moving picture image data having prescribed time differences that have been distributed from said image data distribution device, and selects necessary data from the moving picture image data that have been received to reconstruct one set of moving picture image data; and

a third step in which said image data distribution device performs priority control such that, only during said prescribed interval, said plurality of sets of identical moving picture image data having prescribed time differences are received together in said image data reception device, and

when the transmission resource is not sufficient to distribute the moving picture image data,

said image data reception device, at the time of handover, receives only one of said plurality of sets of identical moving picture image data, and

said image data distribution device performs priority control by discarding ones of said plurality of sets of identical moving picture image data other than said only one.

Specifically, Campana and Umeda, either alone or in combination, fails to teach “when the transmission resource is not sufficient to distribute the moving picture image data, the image data reception device receives only one of the plurality of sets of identical moving picture image

data, and the image data distribution device performs priority control by discarding the other sets of identical moving picture image data”.

3. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled “Comments on Statement of Reasons for Allowance.”
